SMART HVAC FOR A SUSTAINABLE CAMPUS

Nishal Sukumar

Sharmendra Desiboyina

Steve Prathik Fernandes

**IEEE**

# PROBLEM STATEMENT

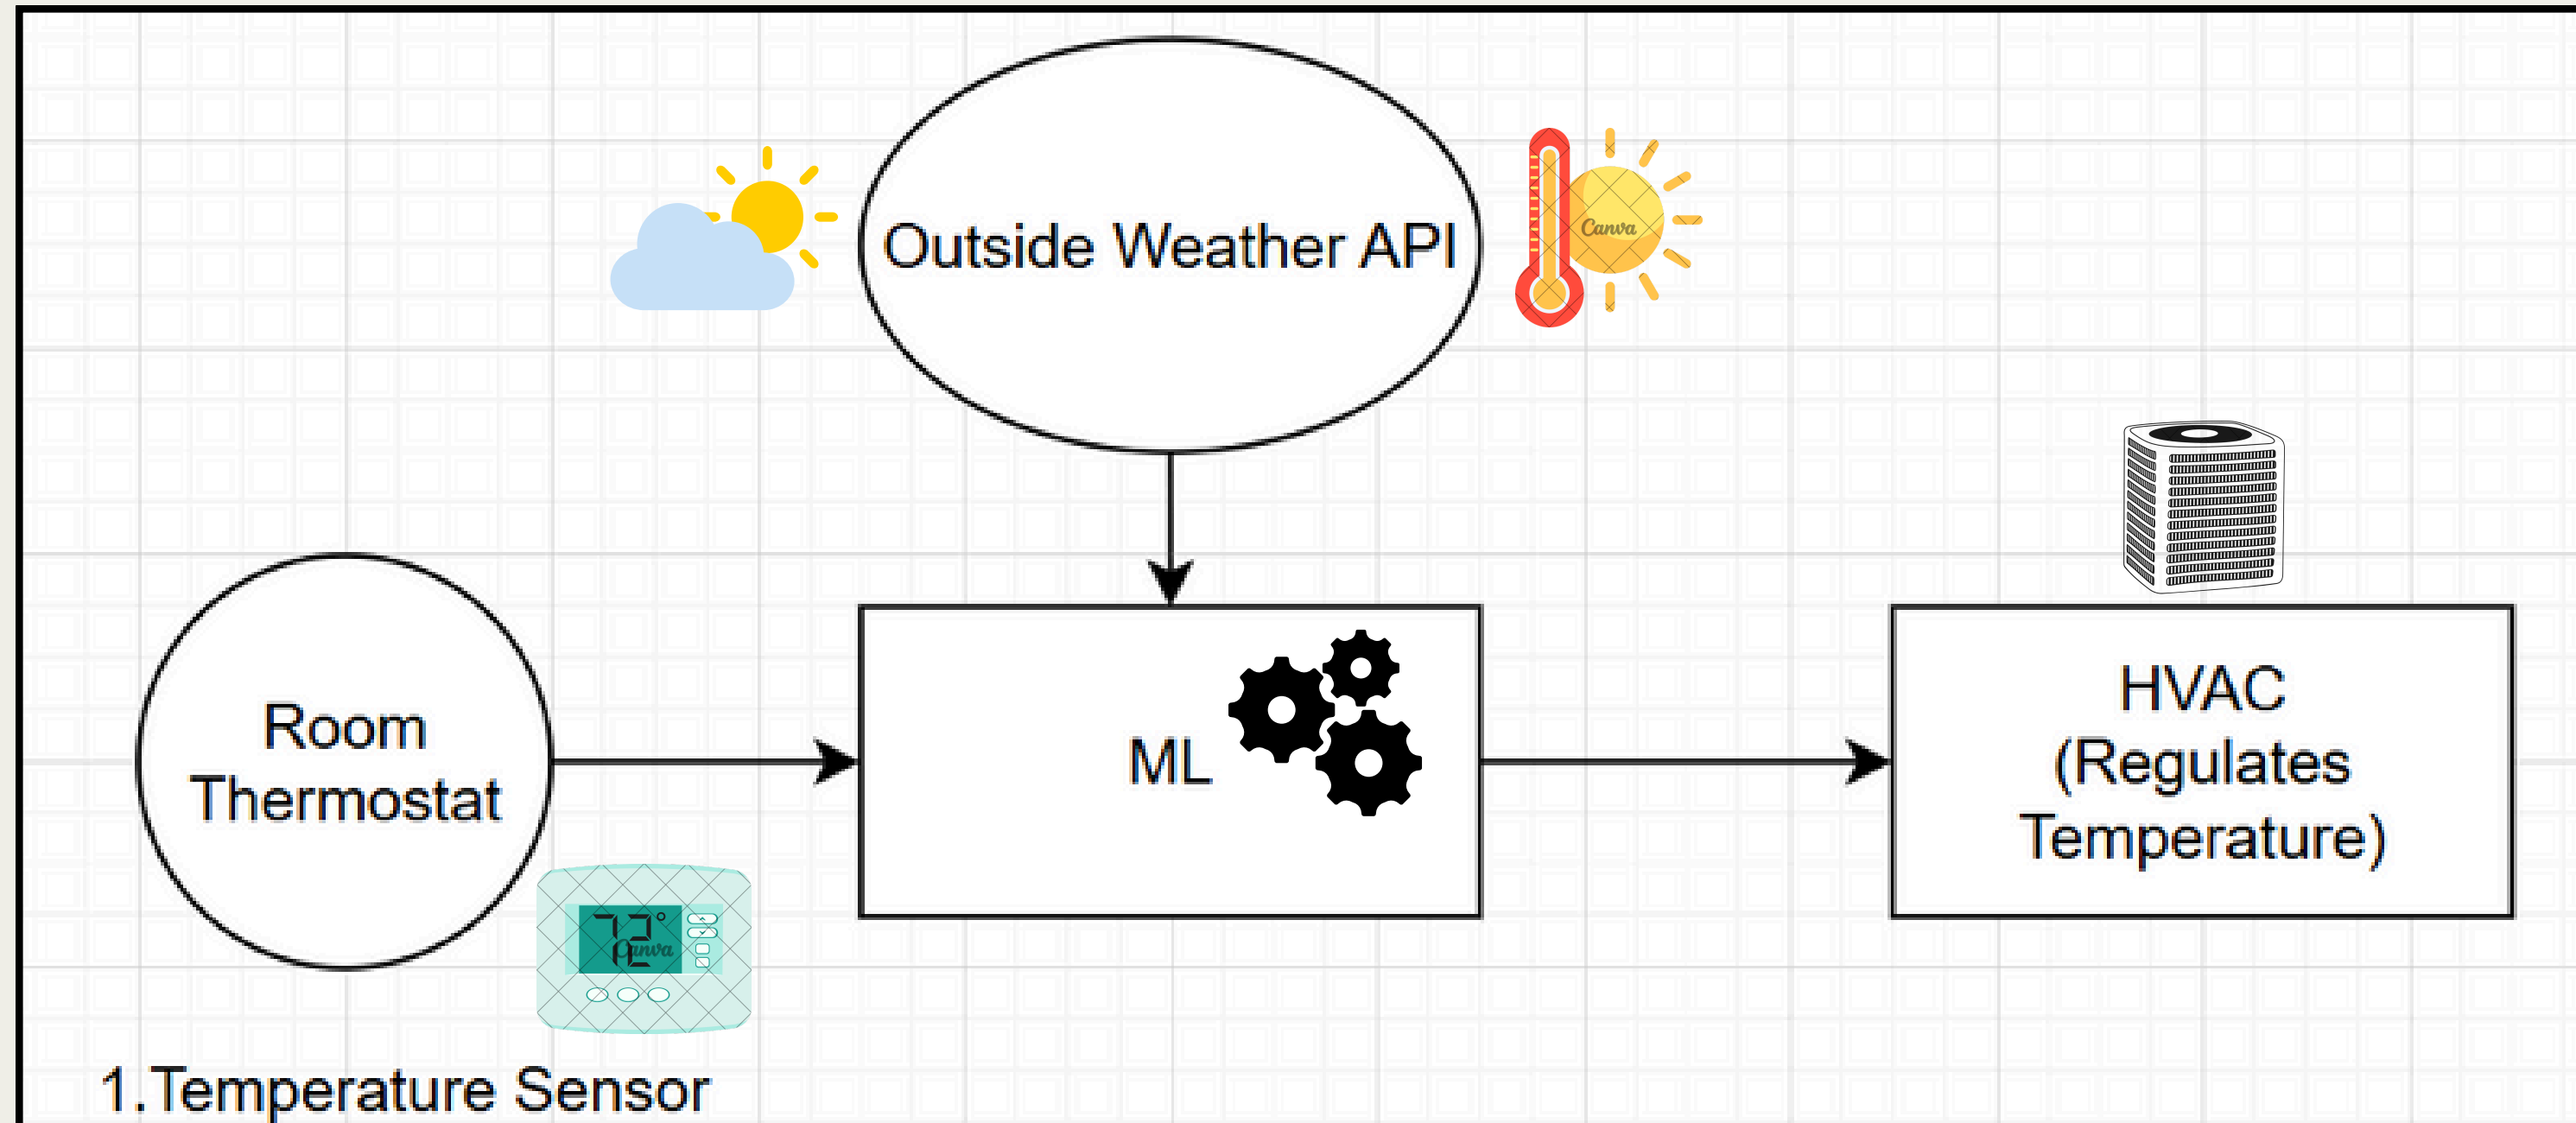

---

- Traditional HVAC systems run continuously at fixed settings ( 70°F), even when rooms are unoccupied, wasting energy.
- Fixed thermostats don't adjust to real-time occupancy or weather shifts, leaving rooms too hot or too cold.
- Unnecessary use of high energy, increases electricity cost and leaves carbon footprint.
- Running HVAC systems at full capacity especially when not needed results in wearing them out faster.

# SOLUTION

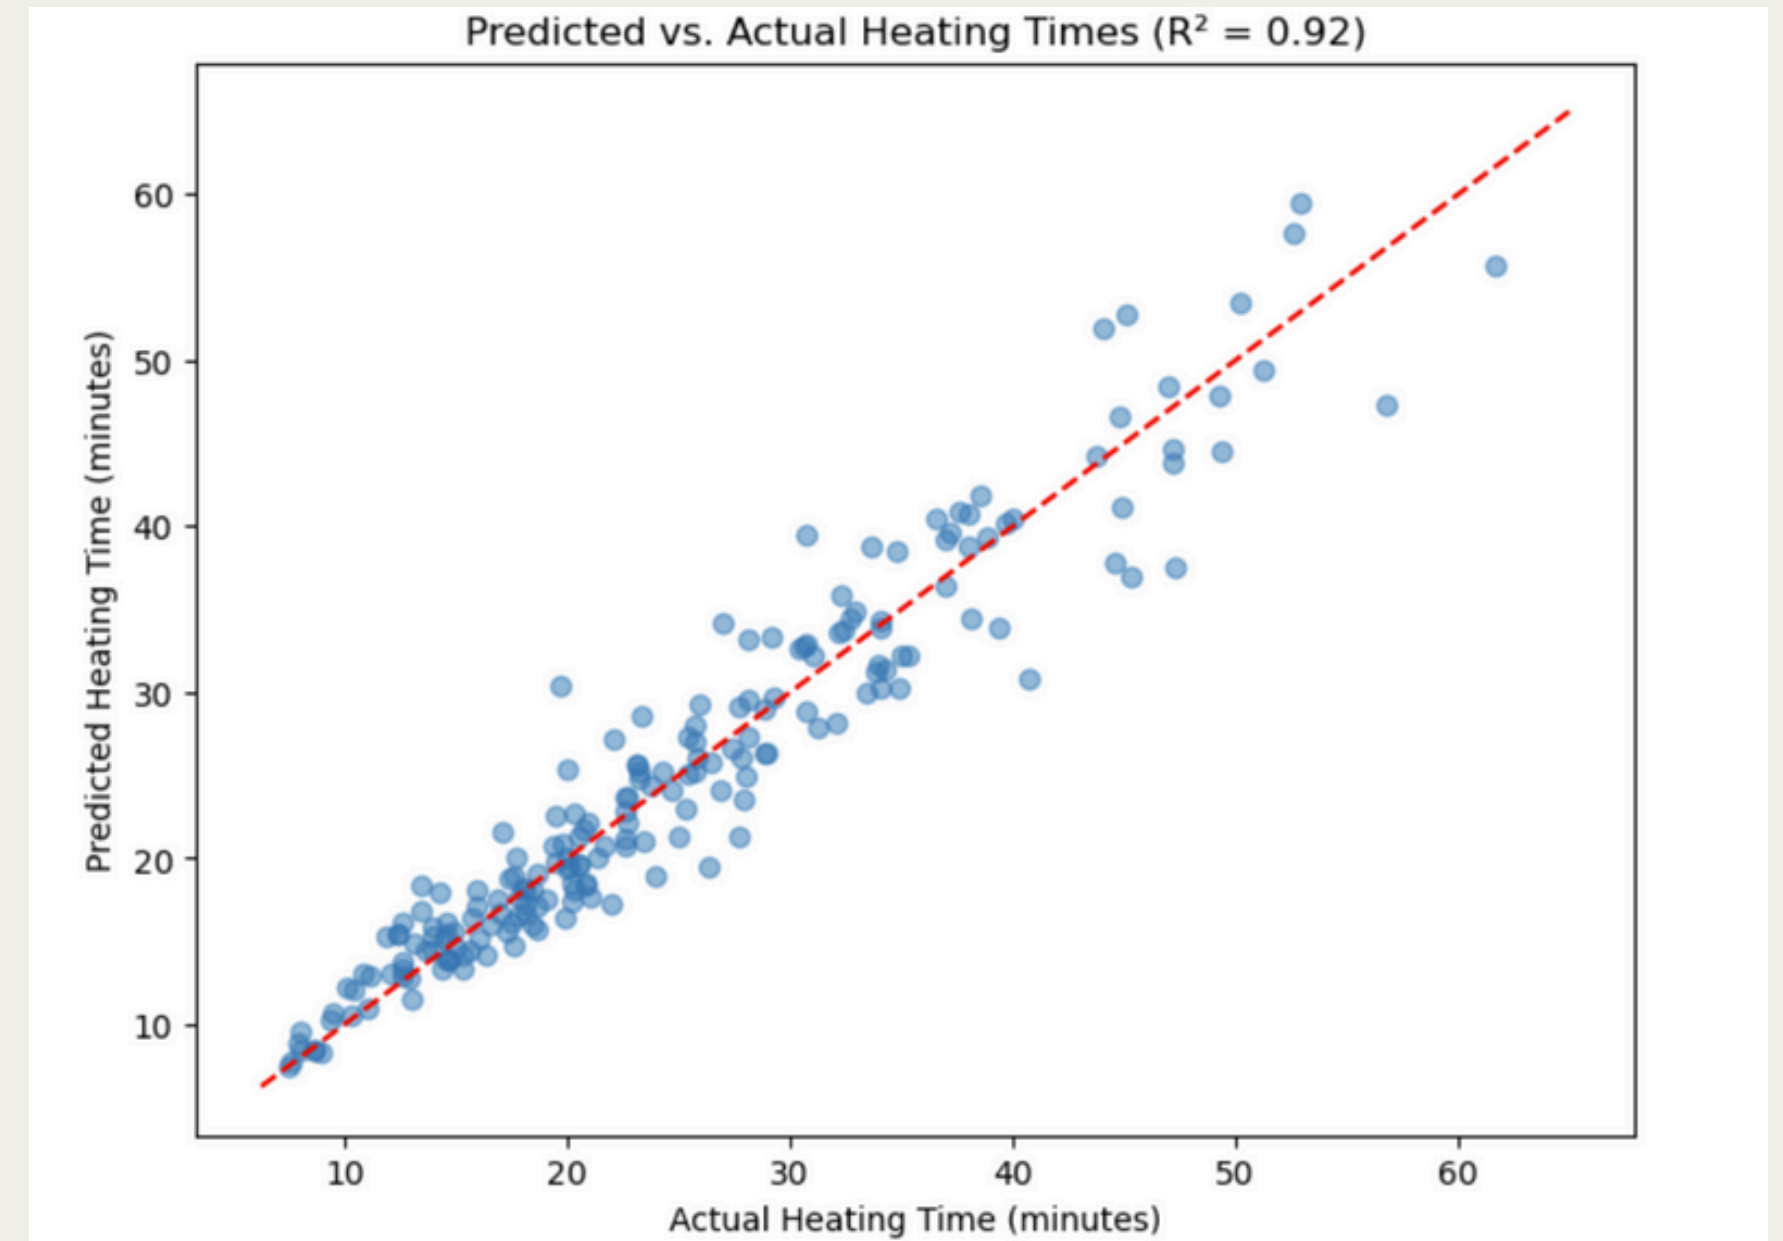

---

# RESULTS

---

- A **Random Forest Regressor** model is used for developing this model.
- We achieved a  **$R^2$** (coefficient of determination) Score **0.93** (93% accuracy in predicting HVAC runtime).

**DEMO**

# ENERGY EFFICIENCY SHOWDOWN

Parameter	System 1 (70°F for 24 hrs)	System 2 (60°F for 19 hrs, 70°F for 5 hrs)
Outdoor Temperature (°F)	34	34
Room Size (ft²)	200	200
COP	3	3
U-value (BTU/hr·ft²·°F)	0.1	0.1
Temperature Difference (°F)	36 (70 - 34)	26 (60 - 34) for 19 hrs, 36 (70 - 34) for 5 hrs
Time (hrs)	24	19 (60°F), 5 (70°F)
Energy Consumption (kWh)	1.688	1.317
Energy Savings (Wh)	-	371.07 (1,687.68 - 1,316.61)
Percentage Reduction (%)	-	21.99% (371.07 / 1,687.68 × 100)
